

User Journey & Conversion Analysis Dashboard

Project Overview

The **User Journey & Conversion Analysis Dashboard** is an interactive Power BI dashboard designed to analyze how users move through different stages of a digital platform, from their initial visit to the final purchase.

The project focuses on understanding user behavior, identifying conversion drop-offs, evaluating traffic sources, and comparing performance across devices and customer types. The dashboard transforms raw user interaction data into actionable business insights through interactive visualizations and KPIs.

Objective

The main objectives of this project are:

- Analyze the complete user journey from **Visit to Purchase**.
 - Identify where users drop off during the conversion process.
 - Measure the overall conversion performance.
 - Compare conversion rates across different devices.
 - Analyze the effectiveness of different traffic sources.
 - Compare new and returning customers.
 - Provide interactive filtering for deeper analysis.
-

Tools & Technologies

- **Microsoft Power BI**
 - **Power Query** – Data transformation and preparation
 - **DAX** – KPI and calculated measure creation
 - **Data Visualization**
 - **Business Intelligence & Analytics**
-

Key Performance Indicators

The dashboard provides an overview of the following key metrics:

KPI	Value
 Total Users	100K
 Total Purchases	10.851K
 Total Sessions	169.834K
 Total Events	357.639K
 Overall Conversion Rate	6.39%

These KPIs provide a quick summary of platform activity, engagement, and conversion performance.

Dashboard Visualizations

1. User Journey Funnel

The funnel visualizes the progression of users through the following stages:

Visit → Product View → Add to Cart → Signup → Checkout → Purchase

It helps identify where the largest number of users drop off before completing a purchase.

2. Conversion Rate by Device

This chart compares conversion performance across:

- Desktop
- Mobile
- Tablet

The analysis helps determine which platform provides the most effective conversion experience.

3. Conversion Rate by Traffic Source

Traffic sources such as:

- Email
- Direct
- Google
- Referral
- Paid Ads
- YouTube
- Instagram
- Facebook

are compared based on their conversion performance.

This helps identify which marketing channels bring higher-quality users.

4. Conversion Rate by Customer Type

The customer type analysis compares:

- Returning Customers
- New Customers

This visualization helps understand the contribution of different customer groups to overall conversions.

5. Visits by Traffic Source

This chart analyzes the number of sessions generated by different traffic channels.

It helps answer an important business question:

Which channels bring the highest volume of traffic, and are those visitors converting effectively?

Interactive Features

The dashboard includes interactive slicers for:

- Customer Type
- Device
- Traffic Source
- Location
- Event Timestamp

Users can dynamically filter the entire dashboard and analyze specific segments of user behavior.

Key Insights

Some important insights that can be derived from the dashboard include:

- A significant decrease in users can be observed as they move through the conversion funnel.
 - Desktop users show a higher conversion rate compared to Mobile and Tablet users.
 - Different traffic sources generate different levels of traffic and conversion performance.
 - Returning and new customers show different contributions to overall conversions.
 - High traffic does not necessarily mean high conversion, making it important to analyze both metrics together.
-

Dashboard Design

The dashboard was designed with a consistent **pink/purple accent theme** to create a modern and visually appealing interface.

Key design elements include:

- Rounded KPI cards
- Custom icons for each KPI
- Consistent color palette across visuals
- Clear visual hierarchy
- Interactive slicers
- Structured grid-based layout
- Minimal and clean design

The goal was not only to analyze data but also to make the insights easy for stakeholders to understand quickly.

Business Value

This dashboard can help businesses:

- Identify conversion bottlenecks.
 - Improve the user experience.
 - Optimize marketing channels.
 - Understand customer behavior.
 - Improve device-specific experiences.
 - Focus on customer retention.
 - Make data-driven business decisions.
-

Future Improvements

Possible future enhancements include:

- Revenue and sales analysis
 - Average Order Value analysis
 - Monthly and yearly conversion trends
 - Customer segmentation
 - Funnel drop-off percentage at each stage
 - Predictive analysis for purchase probability
 - Customer churn prediction
-

Skills Demonstrated

Through this project, I demonstrated skills in:

Power BI • DAX • Data Visualization • KPI Development • Business Analysis • Interactive Dashboard Design • User Journey Analysis • Conversion Funnel Analysis
