

User Journey & Conversion Analysis Dashboard

An interactive Power BI dashboard that transforms raw user interaction data into actionable business insights — tracking every step from first visit to final purchase.

Understanding User Behavior

This dashboard analyzes how users move through a digital platform — from initial visit to final purchase. It focuses on:

- Identifying conversion drop-offs
- Evaluating traffic sources
- Comparing performance across devices and customer types
- Providing interactive filtering for deeper analysis

OBJECTIVES

What This Dashboard Solves

Conversion Funnel

Track the complete journey from Visit to Purchase

Drop-Off Analysis

Pinpoint where users abandon the conversion process

Device Comparison

Compare conversion rates across Desktop, Mobile, and Tablet

Traffic Sources

Measure effectiveness of each marketing channel

Customer Types

Compare new vs. returning customer contributions

Power BI Stack

Microsoft Power BI

Core platform for interactive dashboard development and reporting

DAX

KPI and calculated measure creation for custom metrics

Power Query

Data transformation and preparation before analysis

Data Visualization

Business intelligence and analytics design principles

KEY METRICS

Dashboard KPIs at a Glance

100K

Total Users

Platform-wide user base

10.8K

Total Purchases

Completed transactions

169.8K

Total Sessions

Platform engagement sessions

357.6K

Total Events

User interactions tracked

6.39%

Conversion Rate

Overall platform conversion

These KPIs provide a quick summary of platform activity, engagement, and conversion performance.

Conversion Funnel & Device Performance

User Journey Funnel

Visualizes user progression through six stages, identifying where the largest drop-offs occur before purchase:

The funnel highlights where users abandon the journey, helping prioritize UX improvements at the highest-impact stages.

Conversion Rate by Device

Compares conversion performance across Desktop, Mobile, and Tablet. **Desktop users show a higher conversion rate** compared to Mobile and Tablet users, helping determine which platform provides the most effective conversion experience.

Traffic Sources & Customer Types

Conversion Rate by Traffic Source

Eight channels compared — Email, Direct, Google, Referral, Paid Ads, YouTube, Instagram, and Facebook — to identify which marketing channels bring higher-quality users and drive stronger conversion performance.

Visits by Traffic Source

Analyzes session volume per channel, answering a key business question: **Which channels bring the highest traffic, and are those visitors converting effectively?**

Conversion Rate by Customer Type

Compares Returning vs. New Customers to understand each group's contribution to overall conversions. Returning and new customers show different conversion patterns, helping teams tailor retention and acquisition strategies.

Dynamic Filtering for Deeper Analysis

Users can dynamically filter the entire dashboard to analyze specific segments of user behavior. The interactive slicers enable deeper exploration across five dimensions:

Customer Type

Device

Traffic Source

Location

Event Timestamp

Key Insights & Dashboard Design

Key Insights

- Significant user drop-off at each funnel stage
- Desktop outperforms Mobile & Tablet in conversion
- Traffic sources vary widely in quality and volume
- High traffic ≠ high conversion — both metrics matter

Design Principles

- Pink/purple accent theme for a modern interface
- Rounded KPI cards with custom icons
- Consistent color palette & clear visual hierarchy
- Structured grid layout — minimal and clean

Impact & Capabilities

Business Value

- Identify conversion bottlenecks and improve UX
- Optimize marketing channels and device experiences
- Understand customer behavior and support retention
- Make data-driven business decisions

Future Improvements

- Revenue, AOV, and trend analysis
- Customer segmentation and churn prediction
- Funnel drop-off percentages per stage
- Predictive purchase probability modeling
